POD Engineering Guide

BRD Analysis Session — Step-by-Step Instructions & Prompt Templates

Applies to	Engagement POD · Enablement POD
Documents used	BRD (your quadrant) + Prompt Engineering Doc (your quadrant)
Tool	Claude — claude.ai or your team's Claude environment
Output	Structured engineering analysis — in chat + downloadable doc
Classification	Internal — Confidential

Read the companion memo before opening this document.

How to Use This Guide

This guide gives each POD the exact steps to run a structured Claude analysis session against their BRD and Prompt Engineering Document. Follow the steps in order. Do not skip the upload sequence — the order matters because Claude needs both documents in context before the prompt runs.

One guide, two PODs.

This document contains instructions and prompts for both the Engagement POD and the Enablement POD. Each POD uses only their own section. The prompts are different — they are tailored to the specific agents, entities, and dependencies of each quadrant. Do not use the other POD's prompt.

⚙ Before You Begin — Check Your Skills

Your development environment has different skills configured than the environment where this guide was produced. Before running the prompt, check which skills are available to you by browsing your skills directory. Replace the placeholder below with the actual skill paths relevant to your environment.

Skill paths in your environment: [ADD YOUR SKILL PATHS HERE]

Universal Steps — Both PODs Follow These

The following four steps apply to both the Engagement and Enablement PODs. Complete all four before running your quadrant-specific prompt.

1

Open a fresh Claude conversation

Start a new chat session. Do not use an existing conversation — cross-context contamination will affect the quality of the analysis.

2

Upload your BRD first

Attach your BRD document to the conversation. Wait for Claude to confirm it has been received before uploading the second document. The BRD must be Document 1.

3

Upload your Prompt Engineering Document second

Attach the Prompt Engineering Document to the same conversation. This is Document 2. Claude now has both documents in context.

4

Confirm both documents before running the prompt

Type: 'I have uploaded two documents. Document 1 is the BRD. Document 2 is the Prompt Engineering Document. Please confirm you have both in context before I proceed.' Wait for Claude's confirmation. Then proceed to your quadrant-specific prompt below.

Why this order matters.

The Prompt Engineering Document is the baseline — it represents the architectural intent that was established before your sprint begins. By uploading the BRD first, Claude establishes the product requirement context. By uploading the Prompt Engineering Document second, Claude can immediately cross-reference the two. The analysis prompt then asks Claude to treat the Prompt Engineering Document as the baseline and the BRD as the requirement — not the other way around.

Engagement POD

AI-Native Partner Activation Network — BRD Analysis Session

What Your Analysis Will Cover

The prompt below asks Claude to analyze your Engagement BRD and Prompt Engineering Document together and produce a structured output covering: executive summary, BRD vs Prompt Doc alignment, architecture decisions, all 4–5 AI agent designs, cross-quadrant dependencies, sprint readiness, risks, and recommended next actions.

Expected Output Sections

Output Section	What Claude Will Produce
1. Executive Summary	5–7 sentence engineering summary of what the Engagement quadrant builds and why it matters
2. Alignment Analysis	Table mapping each BRD capability to Prompt Doc coverage — gaps and overlaps flagged
3. Architecture Decisions	Top 5–7 decisions to lock before Sprint 1, with consequences of deferral
4. Agent Architecture Review	PAS Scoring · Drop-Off Risk · NBA · Recognition Intelligence · Nudge Optimization — each reviewed
5. Cross-Quadrant Dependencies	All interfaces to/from Enablement, Incentives, and Deal Acceleration — ownership and contract status
6. Sprint Readiness	READY / READY WITH CONDITIONS / NOT READY — with Pre-Sprint Gate item status
7. Top Risks	5 risks with probability, impact, and mitigation per risk
8. Next Actions	5–8 concrete, sequenced actions for the next 48–72 hours

Your Prompt — Copy and Paste This Exactly

After Claude confirms it has both documents, copy and paste the following prompt in full. Do not paraphrase or abbreviate it.

```
## CONTEXT
# You are acting as a senior engineering architect for the tenXEngage platform.
# The tenXEngage stack is: Java 21 + Spring Boot 3.2.5 + PostgreSQL 16 + React 18 +
# TypeScript + TanStack Query + Tailwind CSS + shadcn/ui + Kafka + Redis.
# Multi-tenant architecture: every entity is scoped by client_id via Hibernate @Filter.
# All IDs are UUIDs. All dates are ISO 8601. Flyway migrations only.

## YOUR DOCUMENTS
# Document 1 (uploaded): Engagement BRD — AI-Native Partner Activation Network v2.0
# Document 2 (uploaded): Engagement Prompt Engineering Document

## YOUR TASK
# Analyze both documents together and produce a structured engineering analysis.
# The Prompt Engineering Document is the BASELINE — treat it as the established
# architectural intent. The BRD is the product requirement. Your job is to confirm
# alignment between them, surface any gaps or risks, and recommend how this POD
# should proceed.
```

```

## PRODUCE THE FOLLOWING OUTPUT IN ORDER

### 1. EXECUTIVE SUMMARY (5-7 sentences)
# Summarize what the Engagement quadrant is building, its primary value to Cisco-type
# clients, and the key architectural differentiators. Write for a senior engineering
# audience — no marketing language.

### 2. BRD vs PROMPT ENGINEERING DOC — ALIGNMENT ANALYSIS
# For each major capability area in the BRD, confirm whether the Prompt Engineering
# Doc addresses it. Flag any BRD requirements that are NOT covered in the Prompt
# Engineering Doc. Flag any Prompt Engineering Doc sections that go BEYOND the BRD.
# Format as a table: Capability | BRD Coverage | Prompt Doc Coverage | Gap / Note

### 3. ARCHITECTURE DECISIONS TO CONFIRM BEFORE SPRINT 1
# List the top 5-7 architectural decisions this POD must lock before writing code.
# For each: state the decision, why it matters, and what breaks if it is deferred.

### 4. AGENT ARCHITECTURE REVIEW
# The Engagement quadrant has 4-5 AI sub-agents (PAS Scoring, Drop-Off Risk,
# Next-Best-Action, Recognition Intelligence, Nudge Optimization).
# For each agent: confirm the trigger model, input signals, output actions, and
# any cross-quadrant dependencies. Flag any agent whose design has unresolved
# ambiguity in either document.

### 5. CROSS-QUADRANT DEPENDENCIES
# Identify every interface this quadrant exposes to or consumes from Enablement,
# Incentives, and Deal Acceleration. For each dependency: state what is needed,
# which team owns it, and whether the interface contract is defined.

### 6. SPRINT READINESS ASSESSMENT
# Based on both documents, assess whether this POD is ready to begin Sprint 1.
# List any Pre-Sprint Gate items from the Prompt Engineering Doc that are still open.
# Rate overall readiness: READY / READY WITH CONDITIONS / NOT READY.
# If conditions exist, list each one explicitly.

### 7. TOP RISKS
# List the top 5 risks for this quadrant's implementation. For each:
# Risk | Probability (H/M/L) | Impact (H/M/L) | Mitigation

### 8. RECOMMENDED NEXT ACTIONS FOR THE POD
# List 5-8 concrete, sequenced actions this engineering team should take
# in the next 48-72 hours before Sprint 1 begins. Be specific — not generic.

---
# OUTPUT FORMAT: Use clear section headers. Be direct and precise.
# Do not pad with disclaimers. This is an engineering document, not a proposal.
# Where either document is ambiguous, say so explicitly — do not guess.

```

After Claude Responds

Claude will produce the full structured analysis in chat. Once you have reviewed it, ask Claude to produce a downloadable summary document by sending the following follow-up message:

```
# FOLLOW-UP — produce a summary document
```

Based on your analysis above, produce a concise Engineering Analysis Summary document that I can save and share with my POD. It should cover:

1. Executive Summary
2. Top 3 alignment gaps between the BRD and the Prompt Engineering Document
3. Architecture decisions to lock before Sprint 1
4. Sprint readiness rating and any open conditions
5. Top 5 risks
6. Recommended next actions

Format it clearly with section headers. Keep it under 2 pages when printed.
This document will be compared against the original Prompt Engineering Document
at the end of the development sprint.

Save Claude's output.

Copy the full analysis from the chat and save it. Your Engineering Lead will conduct a structured comparison between this output, your team's implementation decisions, and the original Prompt Engineering Document at the end of your development sprint. The analysis you generate today is the baseline for that conversation.

Enablement POD

Partner Revenue Readiness — BRD Analysis Session

What Your Analysis Will Cover

The prompt below asks Claude to analyze your Enablement BRD and Prompt Engineering Document together and produce a structured output covering: executive summary, BRD vs Prompt Doc alignment, architecture decisions, all 3 AI agent designs, the Partner Readiness Score (PRS) design, cross-quadrant dependencies, sprint readiness, risks, and recommended next actions.

Expected Output Sections

Output Section	What Claude Will Produce
1. Executive Summary	5–7 sentence engineering summary of what the Enablement quadrant builds and why it matters
2. Alignment Analysis	Table mapping each BRD capability to Prompt Doc coverage — gaps and overlaps flagged
3. Architecture Decisions	Top 5–7 decisions to lock before Sprint 1, with consequences of deferral
4. Agent Architecture Review	Readiness Gap Detection · Learning Path Recommendation · Deal-Context Training — each reviewed
5. PRS Design Review	Partner Readiness Score calculation, CertificationStatus enum status, scoring model completeness
6. Cross-Quadrant Dependencies	All interfaces to/from Engagement, Incentives, and Deal Acceleration — ownership and contract status
7. Sprint Readiness	READY / READY WITH CONDITIONS / NOT READY — with Pre-Sprint Gate item status
8. Top Risks	5 risks with probability, impact, and mitigation per risk
9. Next Actions	5–8 concrete, sequenced actions for the next 48–72 hours

Your Prompt — Copy and Paste This Exactly

After Claude confirms it has both documents, copy and paste the following prompt in full. Do not paraphrase or abbreviate it.

```
## CONTEXT
# You are acting as a senior engineering architect for the tenXEngage platform.
# The tenXEngage stack is: Java 21 + Spring Boot 3.2.5 + PostgreSQL 16 + React 18 +
# TypeScript + TanStack Query + Tailwind CSS + shadcn/ui + Kafka + Redis.
# Multi-tenant architecture: every entity is scoped by client_id via Hibernate @Filter.
# All IDs are UUIDs. All dates are ISO 8601. Flyway migrations only.

## YOUR DOCUMENTS
# Document 1 (uploaded): Enablement BRD — Partner Revenue Readiness v2.0
# Document 2 (uploaded): Enablement Prompt Engineering Document

## YOUR TASK
# Analyze both documents together and produce a structured engineering analysis.
# The Prompt Engineering Document is the BASELINE — treat it as the established
# architectural intent. The BRD is the product requirement. Your job is to confirm
# alignment between them, surface any gaps or risks, and recommend how this POD
# should proceed.

## PRODUCE THE FOLLOWING OUTPUT IN ORDER

### 1. EXECUTIVE SUMMARY (5-7 sentences)
# Summarize what the Enablement quadrant is building, its primary value to Cisco-type
# clients, and the key architectural differentiators. Write for a senior engineering
# audience — no marketing language.

### 2. BRD vs PROMPT ENGINEERING DOC — ALIGNMENT ANALYSIS
# For each major capability area in the BRD, confirm whether the Prompt Engineering
# Doc addresses it. Flag any BRD requirements NOT covered in the Prompt Engineering Doc.
# Flag any Prompt Engineering Doc sections that go BEYOND the BRD.
# Format as a table: Capability | BRD Coverage | Prompt Doc Coverage | Gap / Note

### 3. ARCHITECTURE DECISIONS TO CONFIRM BEFORE SPRINT 1
# List the top 5-7 architectural decisions this POD must lock before writing code.
# For each: state the decision, why it matters, and what breaks if it is deferred.

### 4. AGENT ARCHITECTURE REVIEW
# The Enablement quadrant has 3 AI sub-agents (Readiness Gap Detection,
# Learning Path Recommendation, Deal-Context Training).
# For each agent: confirm the trigger model, input signals, output actions, and
# any cross-quadrant dependencies. Flag any agent whose design has unresolved
# ambiguity in either document.

### 5. CERTIFICATION & READINESS SCORE DESIGN
# The Partner Readiness Score (PRS) is the core output of this quadrant.
# Confirm how the PRS is calculated from the documents. Identify any gaps in the
# scoring model definition. Confirm the CertificationStatus enum is contracts-first
# and flag if it is not yet committed to the contracts repo.

### 6. CROSS-QUADRANT DEPENDENCIES
# Identify every interface this quadrant exposes to or consumes from Engagement,
# Incentives, and Deal Acceleration. For each dependency: state what is needed,
# which team owns it, and whether the interface contract is defined.
```

```

### 7. SPRINT READINESS ASSESSMENT
# Based on both documents, assess whether this POD is ready to begin Sprint 1.
# List any Pre-Sprint Gate items from the Prompt Engineering Doc that are still open.
# Rate overall readiness: READY / READY WITH CONDITIONS / NOT READY.
# If conditions exist, list each one explicitly.

### 8. TOP RISKS
# List the top 5 risks for this quadrant's implementation. For each:
# Risk | Probability (H/M/L) | Impact (H/M/L) | Mitigation

### 9. RECOMMENDED NEXT ACTIONS FOR THE POD
# List 5-8 concrete, sequenced actions this engineering team should take
# in the next 48-72 hours before Sprint 1 begins. Be specific – not generic.

---
# OUTPUT FORMAT: Use clear section headers. Be direct and precise.
# Do not pad with disclaimers. This is an engineering document, not a proposal.
# Where either document is ambiguous, say so explicitly – do not guess.

```

After Claude Responds

Claude will produce the full structured analysis in chat. Once you have reviewed it, ask Claude to produce a downloadable summary document by sending the following follow-up message:

```

# FOLLOW-UP – produce a summary document
Based on your analysis above, produce a concise Engineering Analysis Summary document
that I can save and share with my POD. It should cover:
1. Executive Summary
2. Top 3 alignment gaps between the BRD and the Prompt Engineering Document
3. Architecture decisions to lock before Sprint 1
4. Partner Readiness Score design – confirmed or gaps flagged
5. Sprint readiness rating and any open conditions
6. Top 5 risks
7. Recommended next actions

# Format it clearly with section headers. Keep it under 2 pages when printed.
# This document will be compared against the original Prompt Engineering Document
# at the end of the development sprint.

```

Save Claude's output.

Copy the full analysis from the chat and save it. Your Engineering Lead will conduct a structured comparison between this output, your team's implementation decisions, and the original Prompt Engineering Document at the end of your development sprint. The analysis you generate today is the baseline for that conversation.

End-of-Sprint — What Happens Next

At the end of your development sprint, your Engineering Lead will conduct a structured comparison between three things: the original Prompt Engineering Document, the Claude analysis summary your POD produced at the start of the sprint, and your team's actual implementation decisions.

What the Comparison Covers

- Which Prompt Engineering Document decisions your team followed — and whether they worked as expected
- Where your team deviated from the document — and why
- Where the document was wrong, incomplete, or needed to evolve based on what you learned in the sprint
- What should be updated in the Prompt Engineering Document for the benefit of other quadrants

Be ready for this conversation.

This is not a performance review. It is an engineering retrospective against a documented baseline. The teams that get the most value from this process are the ones who kept notes on their decisions as they built — not the ones who try to reconstruct their thinking at the end.
